which stimulate tissue repair and cell growth factor sub-units - cell growth, used for inducing Vascular endothelial vascular endothelial growth.

Example; Fig 3; 61pp; English

GS-9L cells were cultured and the VEGF AB subunits were isolated and sequenced. The reduced and carboxymethylated protein eluted as two peaks at approx. 23 and 25 ml that were of approx. equal area as determined by monitoring absorbance at 210 nm. Samples of the two protien subuntits isolated after reduction and carboxymethylation were each applied to polybrene-coated glass fiber filters and their N-terminal sequences were determined. The peak of absorbance eluting at approx 25 ml (A subunit)

```
ó
yielded an amino terminal sequence Ala Pro Thr Glu Gly Glu Gln Lys Ala His Glu Val Val identical to VEGF AA. The peak of absorbance eluting at approx. 23 ml (B subunit) yielded the N-terminal sequence Ala Leu Ser Ala Gly Asn Xaa Ser Thr Glu Met Glu Val Val Pro Phe Asn Glu Val plus a nearly equal amount of a truncated form of the same sequence missing the first three residues. The missing X residue corresp. to an Asn in the cloned sequence. The A and sum of the B chain peptides were recovered in nearly equal amonunts supporting the interpretation that the two peptides combine to form an AB heterodimer in VEGF II. The form of VEGF AB mature A subunit in the heterodimer is the 164 amino acid form. The form derived from the 158 full length amino acid form. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                       120

                                                                                                                                                                                                            9
primers based on the amino acid sequences from polypeptide L50 are used to PCR amplify the central region of the cDNA for VEGF AB, B monomer. A single band migrating at 108 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (pYG) was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA. These 5' and 3' clones are denoted p5V2 and p3V2 respectively. The entire base sequence for the 158 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous E subunit are shown in AAQ28955 and AAQ28956. (Updated on 25-MAR-2003 to correct PD field.)

                                                                                                                                                              The full-length coding region of the B monomer was determined from four sets of overlapping cDNA clones. PCR primers were designed based on the amino acid sequence of a Leu C peptide (L50) and used to amplify the central region of the cDNA. A single band migrating at 108bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA and complete the full-length sequence. The VEGF-II can exist as a homodimer or as a heterodimenth an A-subunit (see AAR22347). VEGF-II can be used to stimulate endothelial cells for induction of blood vessel growth, for vascular repair and for production of artificial blood vessels. See also AAQ23038

| vessel.
                                                                                                                                                                                                       The present sequence represents a rat vascular endothelial growth f I (VEGF I) A subunit. The present invention describes: (1) a mammal VEGF II protein comprising an A subunit from AAW53639, AAW53640 or AAW53641, and a B subunit from AAW53638, AAW53639 or the first 115-amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used f promoting vascular development and repair and for promoting tissue

The invention relates to a purified and isolated VEGF C subunit amino acid sequence AAY57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or BC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition.

                                     The present sequence represents a rat vascular endothelial growt II (VEGF II) B subunit. The present invention describes: (1) a m VEGF II protein comprising an A subunit from AAW53639, AAW53640 AAW53641, and a B subunit from AAW53638, AAW53639 or the first 1 amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is use promoting vascular development and repair and for promoting tiss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              U
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VEGF; vascular endothelial growth factor; B subunit; tissue g vascular development; artificial blood vessel; repair; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           growth factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is concerned with the human vascular endothelial growth factor (VEGF) C subunit. VEGF is a vascular endothelial cell mitogen and can be used to promote vascular development and repair. The subunit may exist as a homodimer or a heterodimer with the VEGF A or B subunit. VEGF can be used in the treatment of wounds of mammals, to conartificial blood vessels with vascular endothelial cells, in the production of artificial blood vessels and to induce tissue repair or

The invention relates to a method for stimulating angiogenesis or wound healing through vascular repair, neovascularisation or both. The method comprises administering to a patient a pharmaceutically effective amount of mammalian vascular endothelial growth factor II (VEGF-II) comprising the heterodimer of subunits A and B, or a homodimer of B subunits. VEGF-II is useful for vascular development and repair, promotion of tissue repair, and the production of artificial vessels. The present sequence is the mature 135 amino acid form of VEGF II B subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Stimulating angiogenesis or wound healing through vascular repair, neovascularization or both, comprises administering mammalian vascular endothelial growth factor II comprising two different subunits.
                                                                                                                                                                                                         VEGF-II; wound healing; repair; VEGF II B subunit;

The method comprises administering to a patient a pharmaceutically effective amount of mammalian vascular endothelial growth factor II (VEGF-II) comprising a heterodimer of subunits A and B, or a homodimer of B subunits. VEGF-II is useful for vascular development and repair, promotion of tissue repair, and the production of artificial vessels. The present sequence is VEGF I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

VEGF II stimulates mitogenesis of mammalian vascular endothelial cells. VEGF II is useful for promoting tissue repair and for stimulating the growth of vascular endothelial cells. VEGF II can also be

can also be

endothelial

vascular

The present invention relates to the isolation of

growth factor II (VEGF II), and the polynucleotide sequences encoding it.

VEGF II is a heterodimer comprising A and B subunits that are encoded by different genes. VEGF II stimulates mitogenesis of mammalian vascular endothelial cells. VEGF II is useful for promoting tissue repair and for stimulating the growth of vascular endothelial cells. VEGF II can also be used for stimulating the growth of vascular endothelial cells in a patient to promote vascular development and repair, or blood vessel growth (neovascularisation). VEGF II can further be used to produce artificial blood vessels by treating synthetic polymeric vessels with VEGF II and implanting into them into a patient. After the implantation endothelial cells migrate into and grow on the artificial surface. The present sequence represents rat VEGF I A subunit cleavage product #2

ering an a first comprises administ factor comprising cell growth cell growth desegnence. Stimulating vascular endothelial camount of a vascular endothelial cand a second C subunit amino acid

Example 10; Fig 8; 58pp; English

the Also The invention relates to stimulating vascular endothelial cell growth comprises administering to a patient an effective vascular endothelial stimulatory amount of a vascular endothelial cell growth factor (VEGF) comprising a first and a second C subunit amino acid sequence, where the first and second subunits comprise a sequence appearing as ADA25607. A disclosed as new are rat VEGF-A, -B and C subunit cDNAs and proteins.

Degenerate oligo. primers based on the amino acid sequences from polypeptide L50 are used to PCR amplify the central region of the cDNA for VEGF AB, B monomer. A single band migrating at 108 bp was gel purified, digested with Sall, ligated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (pYG) was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA. These 5' and 3' clones are denoted p5V2 and p3V2 respectively. The entire base sequence for the 158 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous B subunit and the 138 amino acid microheterogeneous in AAQ28955 and AAQ28956. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         growth factor sub-units - which stimulate growth, used for inducing tissue repair and

The two forms are generated by alternative splicing of the mRNA transcript prior to translation. The proteins can be isolated from glioma cell-conditioned medium. For example, the rat cell line GS-9L was grown to confluence in MEM. VEGF-II was purified from the conditioned medium by carboxymethyl-Sephadex chromatography, polyaspartic acid WCX HPLC cation exchange chromatography, metal chelate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a rat vascular endothelial growth factor I (VEGF I) A subunit. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from AAW53639, AAW53640 or AAW53641, and a B subunit from AAW53638, AAW53639 or the first 115-135 amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue repair

Sequence 14, Application US/08469427A

Patent No. 5607918

GENERAL INFORMATION:

APPLICANT: Eriksson, Ulf

APPLICANT: Olofsson, Birgitta

APPLICANT: Alitalo, Kari

APPLICANT: Pajusola, Katri

TITLE OF INVENTION: VASCULAR ENDOTHELIAL GROWTH FACTOR-B AND

TITLE OF INVENTION: DNA CODING THEREFOR

TITLE OF SEQUENCES: 17

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MARIA

Sequence 55, Application US/08795430
Patent No. 6130071
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Alitalo, Kari
APPLICANT: Joukov, Vladimir
TITLE OF INVENTION: Vascular Endothelial Growth Factor
TITLE OF INVENTION: Protein and Gene, Mutants Thereof,
NUMBER OF SEQUENCES: 57
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Boru
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gerstein, Murray & South Wacker Drive

Missing (in isoform PlGF-1 and isoform PlGF-2). Also found a as homodimer but PIGF-2 in mos week) cell IsoId=P49763-1; Sequence=Displayed;

IsoId=P49763-1; Squence=VSP\_004644;

IsoId=P49763-2; Sequence=VSP\_004644;

Name=PIGF-2; Synonyms=PIGF-152;

IsoId=P49763-3; Sequence=VSP\_004644, VSP\_004645;

TISSUE SPECIFICITY: While the three forms are present in moplacental tissues, the PIGF-2 is specific to early (8 week) placenta and only PIGF-1 is found in the colon and mammary heparin retention signal. PTM: N-glycosylated. SIMILARITY: Belongs to the PDGF/VEGF growth factor family of cell proliferation; ; TAS. which acts as PLACENTA GROWTH FACTOR. HEPARIN-BINDING (PROBABLE) forms are secreted unless released by Glycoprotein; 3D-structure isoforms=3 GO; GO:0008083; F:growth factor activity; TAS.

"Structure and expression of bovine VEGF family.";
Structure and expression of bovine VEGF family.";
Submitted (MAY-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Growth factor active in angiogenesis, and endother cell growth, stimulating their proliferation and migration binds to receptor VEGFR-1/FLT1 (By similarity).

-!- SUBUNIT: Antiparallel homodimer; disulfide-linked. Also for heterodimer with VEGF/VEGF-A (By similarity).

-!- SUBCELLULAR LOCATION: Secreted (By similarity).

-!- SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                  5

Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Growth factor active in angiogenesis, vasculogenesis ar endothelial cell
growth. It induces endothelial cell
proliferation, promotes cell migration, inhibits apoptosis, and
induces permeabilization of blood vessels. It binds to the
VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as heterodimer

J. Biol. Chem. 271:3877-3883(1996).

-!- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).

-!- SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expressed mainly in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                with PlGF (By similarity).

SUBCELLULAR LOCATION: VEGF-1 and VEGF-2 are secreted while VEGF-3 remains cell-surface associated unless released by heparin.

TISSUE SPECIFICITY: In developing embryos, expressed mainly in the choroid plexus, paraventricular neuroepithelium, placenta and kidney glomeruli. Also found in bronchial epithelium, adrenal gland and in seminiferous tubules of testis. High expression of vegF continues in kidney glomeruli and choroid plexus in adults. VegF continues in kidney glomeruli and choroid plexus in adults.

endothelial growth factor.placenta growth factor heterodimer.";

J. Biol. Chem. 270:7717-7723(1995).

- 1- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell prowth. It induces endothelial cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).

- SUBCELLULAR LOCATION: VEGF-A120 is acidic and freely secreted.

VEGF-A164 is more basic, has heparin-binding properties and, although a signicant proportion remains cell-associated, most is freely secreted. VEGF-A188 is very basic; it is cell-associated after secretion and is bound avidly by heparin and the extracellular matrix, although it may be released as a soluble form by heparin, heparinase or plasmin (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rough a collaboration be EMBL outstation - restrictions on its

"Vascular endothelial growth factor induces cyclooxygenase-dependent proliferation of endothelial cells via the VEGF-2 receptor.";
FASEB J. 15:1667-1669(2001).
-!- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell prowth. It induces endothelial cell promotes cell migration, inhibits apoptosis, and proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       blocking

It induces endothelial cell promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the vEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).

SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PIGF (By similarity).
                                                                                                                                                                                                                                                                        84 GGCCNDEGLECVPTEESNITMQIMRIKPHQGQH-IGEMSFLQHNKCECRPKKDRARQEKK

Cloning of cDNA and high-level expression of equine vascular

endotherial growth factor (VEGF).";

Submitted (JAN-2001) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Growth factor active in angiogenesis, and endothelial cell growth. Induces endothelial proliferation and vascular permeability (By similarity).

-!- SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PIGF (By similarity).

-!- SUBCELLULAR LOCATION: Secreted but remains associated to cells to the extracellular matrix unless released by heparin (By similarity).

-!- SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mer

R Flamme I., Breier G., Risau W.;

T "Vascular endothelial growth factor (VEGF) and VEGF receptor 2

(flk-1) are expressed during vasculogenesis and vascular

differentiation in the quail embryo.";

Dev. Biol. 169:699-712(1995).

-!- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell

proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fil-1 and VEGFRI/Kdr receptors and to heparan sulfate and heparin (By similarity).

C -!- SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PlGF (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               collaboration -

In kidney glomeruli, brain and yolk sac, VEGF-166 i 10-times more abundant than VEGF-190. DEVELOPMENTAL STAGE: VEGF-166 is expressed early at day 1 upgraded during gastrulation. Expression of VEGF-190 is defonly from day 2. DOMAIN: VEGF-190 contains a basic insert which acts as a contains a basic insert which acts are contained and acts a

Rerrara N., Henzel W.J.;

"Pituitary follicular cells secrete a novel heparin-binding grow factor specific for vascular endothelial cells.";

Biochem. Biophys. Res. Commun. 161:851-858(1989).

-!- FUNCTION: Growth factor active in angiogenesis, vasculogenes endothelial cell growth. It induces endothelial cell promotes cell migration, inhibits apoptosis, induces permeabilization of blood vessels. It binds to the vEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate heparin (By similarity).

-!- SUBUNIT: Homodimer; disulfide-linked. Also found as heterodi
